

The Miniatom Project

Was it suicide or was it murder? That is the dilemma the Geneva police face as they examine the body of Trevor McCallum, a world famous physicist with his head merged in the monitor of his computer. McCallum was working on a bizarre theory that would alter the constants of nature and human life on Earth, the police learn. If he had been less of a scientist the theory would have been thought of as the ramblings of a madman, but McCallum was revered as one of the most brilliant physicists of his generation. Was it a jealous colleague who killed him? What did the KGB learn from hacking his computer? Was trying to prove his incredible theory drove him to take his own life? And why was his computer refusing to respond? This mystery unfolds in laboratories throughout the world especially the famous CERN in Switzerland . It will keep you turning pages until the very end when you learn that reality is not always what it seems and the world of nuclear physics is alive with drama and excitement and a computer may have its own evil intentions. Richard M. Weiner is a prominent atomic physicist associated with the Universities of Paris, France and Marburg, Germany. His escape from behind the Iron curtain and joining of the European Organization for Nuclear Research (CERN) made headlines in the media. As a young physicist, already, his colleagues considered his research work worthy of a Nobel Prize. A Professor of Theoretical Physics, he has worked in all of the institutions he has written about in this first science and murder novel.
